Spring 2002

2001 Missouri county population estimates

Population estimates for 2001 for Missouri counties have been prepared and released by the Missouri Office of Administration and the U.S. Census Bureau. The estimates provide insight into the population shifts that have occurred in the state since the 2000 Census. (See table on page 4.)

"Our population growth slowed from its pace in the late 1990s," notes Ryan Burson, state demographer. "The Ozarks and several of our urban counties grew substantially, but many of our rural counties experienced losses after gaining population last decade."

The state's population increased by 34,496 people between 2000 and 2001, bringing the total state population to 5,629,707 on July 1, 2001. This 0.6 percent growth rate compares to a national growth rate of 1.2 percent over the same period. Most of the growth was due to a natural increase (births minus deaths) of 25,915 persons. Other growth can be attributed to a net migration gain of 8,581 persons.

St. Charles County led all counties by a wide margin with a total growth of 12,796 persons. St. Louis City lost the most population, declining by an estimated 8,978 persons over the 15-month period between the April 1, 2000 census and the July 1, 2001 population estimates.

Estimated population change in Missouri counties during the 18 months after Census 2000

The fastest-growing counties in percentage terms between 2000 and 2001 were Christian (5.5 percent), Lincoln

(5.3 percent), St. Charles (4.5 percent), Cass (4.3 percent), Warren (3.8 percent), Webster (3.7 percent), and Platte (3.3 percent). All are counties within the metropolitan areas of St. Louis, Kansas City, or Springfield. Areas experiencing the greatest percentage decline were St. Louis City (-2.6 percent), Maries (-2.4 percent), Mississippi (-2.0 percent), Saline (-1.8 percent), Howard (-1.7 percent), New Madrid (-1.7 percent), and Chariton (-1.7 percent).

The 2001 county estimates were prepared through a cooperative program between the state and federal governments and are based on administrative records of population change since April 1, 2000. For current estimates of other areas in the United States, consult the Census Bureau's website at <http://eire.census.gov/popest/estimates.php>.

National Geographic features GIS work in Missouri

The April 2002 *National Geographic* includes an article about Jim Harlan's successful use of geographic information system (GIS) software to create computer-generated maps that show the exact route of the Lewis and Clark Expedition through Missouri in 1804. Harlan is a senior research specialist at the University of Missouri's Geographic Resources Center.

The Missouri State Archives, a division of Secretary of State Matt Blunt's office, commissioned the Lewis & Clark historic maps to commemorate the bicentennial of the Corps of Discovery expedition, which begins in 2004.

By using 19th century land survey records held at the Missouri State Archives and primary source material from the Lewis and Clark expedition, Harlan was able to accurately map the course of the Missouri River

at the time of the expedition through Missouri.

The project also included the building of a "Lewis & Clark Across Missouri River" website at <http://lewisclark.geog.missouri.edu/index.shtml> to enhance understanding of the Lewis and Clark expedition. The website provides visual depictions of the course Meriwether Lewis and William Clark followed as they journeyed across Missouri, then part of the newly acquired Louisiana Purchase territory. On the website, Lewis and Clark campsites along the Missouri River can be selected, resulting in a visual image of what the area looked like at the time the two explorers first viewed the land.

TIGER 2000

The Census Bureau has issued a new version of the Topologically Integrated Geographic Encoding and Referencing system (TIGER) which includes Census 2000 urbanized areas, urban clusters, and public use microdata areas (PUMAs). TIGER is a digital geographic database, which was introduced after the 1990 census. The system automates mapping and geography activities required to support Census Bureau work.

The content of the TIGER database undergoes continuous updates, and it is made available to the public through TIGER/line® files available free of charge on the Internet. TIGER/line® files on CD-ROM or

DVD can be purchased from the Census Bureau's Customer Service Office in Washington, D.C. (telephone: 301-457-4100)

For additional information about TIGER and to access the TIGER/line® files on the Internet, visit the Census Bureau's website at <http://www.census.gov> and select "TIGER" in the geography section of the homepage.

Vol. 6, No. 2 – 2002

Missouri Census Update (ISSN 1092-9509) is published quarterly by the Office of the Secretary of State to fulfill contractual obligations to the U.S. Bureau of the Census in connection with the State Data Center Program authorized under Title 13, United States Code, Section 8(b). The newsletter is distributed to the Census Bureau, other state data centers, affiliate agencies, libraries, universities, state agencies, and other interested parties.

For more information about the newsletter or the Missouri Census Data Center, contact the MCDC Coordinator, Missouri State Library, P.O. Box 387, Jefferson City, Missouri 65102-0387; tel: 573-526-7648; <http://mcdc.missouri.edu>

The commute to work

Out of the 2.6 million workers age 16 and older who work in Missouri, 80.5 percent drive alone in a car, truck or van to work. The other 19.5 percent carpool (11.6 percent), work at home (3.5 percent), walk (2.1 percent), ride public transportation (1.5 percent), or use other means of travel (0.8 percent) to get to work.

Demographic profiles from the Census Bureau

Based on Census 2000 data, the Census Bureau has created four-page demographic profiles in pdf format. The profiles provide an excellent overview of the U.S., states, counties, towns, minor civil divisions, and metropolitan statistical areas. Page one of each profile includes information such as age, race, and household composition from the short-form (100 percent) count. Pages two, three, and four include information from the Census 2000 long-form questionnaire (sample data), and display selected social, economic, and housing characteristics. The profiles include statistics for specific items such as educational attainment, disability, language spoken at home, residence five years ago, employment status, means for commuting to work, occupation worked, household and family income, poverty, year housing structure built, year householder moved into unit, mortgage status, and gross rent. Demographic profiles for the entire nation are posted on the Missouri Census Data Center website at <http://mcdc2.missouri.edu/webrepts/sf3pros/index.html>.

Census Bureau marks first century

This year marks the 100th anniversary of the U.S. Census Bureau. It was formed as a permanent office in the Department of the Interior in 1902, early in Theodore Roosevelt's administration. Prior to the establishment of a permanent agency, temporary workers—usually appointed for their loyalty to the political party in power at the time—conducted the census.

In 1903, the Census Bureau was transferred from the Department of the Interior to the newly created Department of Commerce and Labor. Employees included women in long skirts and blouses and men in white shirts and ties who handled punch cards, electric tabulating machines, and sorters. They worked in open-bay offices that were cooled by slow-moving ceiling fans. Using the 1900 census as a base, the new Census Bureau issued intercensal population estimates and collected data on cotton ginnings, forestry products, and published a product known as "the social statistics of cities."

When the Department of Labor and

Commerce split into two parts in 1913, the Census Bureau was placed under the Department of Commerce, where it remains today.

Over the years, the agency has documented a rapidly changing society, broken new ground in statistical and survey methodology, and become known as a pioneer in the area of data processing. In 1951, the Census Bureau moved from punch card machines to the Universal Automatic Computer (UNIVAC I), the first electronic computer used by a civilian government agency. With its vacuum tubes, blinking lights, and whirling lights, UNIVAC I ushered in the computer era.

To celebrate its centennial, the Census Bureau held a ceremony featuring a color guard, centennial quilt, and a census anthem at the place it has called headquarters since the World War II era: Suitland, Maryland, just outside Washington, D.C.

For additional information, see the Census Bureau's centennial website at <http://www.census.gov/mso/www/centennial>.

A 1940 Census employee uses a punch machine to tally results by hand.

Missouri county population and components of change: April 1, 2000 to July 1, 2001

County	July 1, 2001 Estimate	April 1, 2000 Census	Total Change	Percent Change	Components of Change		
					Births	Deaths	Net Migration*

Numbers from Census 2000 for the 65+ population

Just over three-quarters of a million (755,279) people in Missouri—more than 13 percent of the state's population—were age 65 or older in 2000. Out of that total, 40.7 percent were male and 59.3 percent were female. Nearly one out of four (24%) of Missouri households had at least one occupant age 65 or older.

Reflecting comparatively low birth rates in the 1930s and the influx of recent immigrants to the state, who tend to be younger, the percent growth

of the age 65+ population in Missouri between 1990 and 2000 was significantly less than the percent growth of the population as a whole, 5.2 percent compared to 9.3 percent.

Nursing home population age 65+ in Missouri

According to the Census 2000 count, a total of 44,198 people age 65 and older in Missouri lived in nursing homes in April 2000. This number represented 5.9 percent of the total age 65+ population in the state. Women comprise 75 percent of the age 65+ population in nursing homes in the state.

States with highest and lowest number and percent of people age 65+

Not surprisingly, Alaska is the state with the fewest number and lowest percent of residents age 65 or over (35,699 people making up 5.7 percent of the state's population) and Florida is the state with the highest percent of population age 65 or older (17.6 percent, representing 2.8 million people). However, with over 3.5 million people age 65 and older, California ranks first among the states for total number in this age category.

Census 2000: 55% of Missouri residents live in urbanized areas

On May 1, 2002, the Census Bureau released the national lineup of cities meeting the Census 2000 criteria for an "urbanized area." Janice McMillan, senior planner for the City of Jefferson, was excited to find Missouri's capital city on the list. Jefferson City was one of 76 places across the nation newly qualified for the urbanized area designation in 2000.

Over one-half (55%) of the people in Missouri live in the state's eight urbanized areas. To receive this designation, an area must contain at least 50,000 people and meet population density criteria (see: <http://www.census.gov/geo/www/ua/ua2k.html> for detailed information). Eligibility to apply for Urbanized Area Formula Grants from the U.S. Department of Transportation is one of the benefits associated with the designation of urbanized area. Grants from this program provide transit capital and operating assistance to urbanized areas for transportation improvements, including bus and rail.

Urbanized Area in Missouri	Urbanized Area Population
Columbia	98,779
Jefferson City	53,714
Joplin	72,089
Kansas City	799,293
Lee's Summit	55,285

National Archives opens 1930 census records

On April 1, 2002, the 72-year embargo on the release of census information about individuals expired for the 1930 census and the National Archives and Records Administration made the census available to the public on microfilm.

The 1930 census was the last to ask U.S. residents if they could read or write and the last to ask all respondents the same set of questions. In 1940, sample data was introduced when a scientifically-selected sample of households received a "long form," which included a set of questions in addition to those asked of all households.

Other highlights from the 1930 census include:

■ 12 million people had access to radios. A new question that year, "Does this household have a radio?," was designed to measure the extent of the nation's leap into new home-appliance technology.

■ Life expectancy in the U.S. at the dawn of the Great Depression was

less than 60 years, compared to 77 years in 2002.

■ Only 5,165 people resided in the desert outpost of Las Vegas, Nevada, where the railroad was the principal industry. Only 48,118 people resided in Phoenix, Arizona. Today, both cities are among the fastest growing in the nation. Census 2000 population for Las Vegas and Phoenix was 478,434 and 1,321,045, respectively.

■ Veterans could indicate service in World War I, the Spanish-American War, the Civil War, the Philippine Insurrection, the Boxer Rebellion or the Mexican Expedition.

Although the original 1930 census records no longer exist—originals were destroyed after being filmed in 1949—the population schedules are reproduced as National Archives Microfilm Publication T626 and total 2,667 rolls of microfilm. The Missouri portions of the records are on 78 rolls of microfilm. "How to Research the 1930 Census Microfilm" is posted on the Web at: <http://1930census.archives.gov/beginSearch.asp>.

Although federal law seals census records about individuals and individual households for a period of 72 years, people may request a search of federal population censuses from 1910 to 1990 to obtain an official transcript as evidence to qualify for Social Security and other retirement benefits, to make passport applications, prove relationship in settling estates, in genealogy research, and other legitimate reasons when a birth or other certificate may be needed but is not available. The information can be released only to the named person, his/her heirs, or his/her legal representatives. A congressionally mandated fee (currently \$40 for one search) is charged for this service. Additional information about this service and a copy of the BC-600 application are available on the Census Bureau's website at <http://www.census.gov/genealogy/www/agesearch.html>.
